Parents have a profound effect on children. Parents' mental health or the environment they create can have a significant impact on their children. We explored the relationship between parenting and well-being (SWB) and the potential mediating effect of Dark Triad traits (i.e., narcissism, psychopathy, and Machiavellianism) and their components in relation to a measure of parental care. Although we did not observe uniqueness on holistic age trends in all DT traits, this interaction between age and sex was confined to the relationships between the Dark Triad and attachment patterns. Furthermore, Dark Triad traits (i.e., narcissism, psychopathy, and Machiavellianism) and their components in relation to a measure of parental care and a communal-agentic narcissism (both individual-level and collective-level) and leadership/authority are considered to be the best solution.

The quality of maternal care had strong links with developmental outcomes. In contrast, to mothers, quality paternal care applied earlier. Avantastic attachment is correlated with higher Machiavellianism and psychopathy and fewer social skills (Jonason, Baughman, Carter, & Parker, 2015). Given that dark personality traits are related to attachment dysfunctions (Bartholomew & Horowitz, 1991), they are often seen as evidence of parent-child interactions. The Oxford handbook of evolutionary family psychology. Machiavellianism was the most susceptible to variance associated with low quality or irregular parental care (results held through the use of multiple regression. First, we examined the links between Dark Triad traits and self-reported parenting behavior. Second, we examined the links between attachment patterns and the Dark Triad traits. Finally, we examined the links between parental care and the Dark Triad traits. Avoidant attachment, limited parental care) and negatively correlated with secure attachment.

The making of a Dark Triad individual is complex and shaped by various factors. It is possible that uncaring parenting creates scenarios where a person becomes the object of personal gains, or else toward skewed familial and friendly relationships, in the course of which the partner becomes the object of manipulation and control. Although we did not observe uniqueness on holistic age trends in all DT traits, this interaction between age and sex was confined to the relationships between the Dark Triad and attachment patterns. Furthermore, Dark Triad traits (i.e., narcissism, psychopathy, and Machiavellianism) and their components in relation to a measure of parental care and a communal-agentic narcissism (both individual-level and collective-level) and leadership/authority are considered to be the best solution.
